

Press Release

RedHill Biopharma Reports Positive FDA Type B Meeting on RHB-105 for *H. pylori* Infection Ahead of Confirmatory Phase III Study

- The confirmatory Phase III study with RHB-105 for *H. pylori* infection is planned to be initiated in H1/2017, after completion of the ongoing supportive PK program; Subject to a successful outcome, the confirmatory Phase III study and the supportive PK program are expected to complete the package required for a U.S. NDA for RHB-105, including clinical data and chemistry, manufacturing and controls (CMC)
- Following the recent Type B CMC meeting, and subject to final minutes of the meeting, the FDA has accepted RedHill's manufacturing plan towards filing the CMC package as part of a potential future U.S. New Drug Application (NDA) for RHB-105
- The first Phase III study with RHB-105 successfully demonstrated 89.4% efficacy in eradicating *H. pylori* infection ($p < 0.001$), supporting the potential superior efficacy of RHB-105 over current standard-of-care (SoC) therapies
- RHB-105 was granted QIDP designation by the FDA under the GAIN Act, including Fast-Track development, NDA Priority Review and extended U.S. market exclusivity, for a total of eight years
- With the rise in antibiotic resistance and consequent failure rates of SoC therapies, *H. pylori* is an increasingly important human pathogen; It is a major cause of chronic gastritis, peptic ulcer disease, gastric cancer and mucosa-associated lymphoid tissue (MALT) lymphoma
- *H. pylori* infection is estimated to affect over half of the adult population worldwide; The 2015 global and U.S. market potential for *H. pylori* eradication therapies are estimated at approximately \$4.83 billion and \$1.45 billion, respectively

TEL-AVIV, Israel, November 10, 2016 RedHill Biopharma Ltd. (NASDAQ; RDHL) (TASE: RDHL) ("RedHill" or the "Company"), a biopharmaceutical company primarily

focused on the development and commercialization of late clinical-stage, proprietary, orally-administered, small molecule drugs for gastrointestinal and inflammatory diseases and cancer, today announced that it has concluded a positive Type B Meeting with the U.S. Food and Drug Administration (FDA) discussing the chemistry, manufacturing and controls (CMC) aspects of the RHB-105 Phase III development program. RHB-105 is a proprietary, fixed-dose, oral combination therapy for the eradication of *H. pylori* infection.

Subject to final minutes of the meeting, the FDA has accepted RedHill's manufacturing plan towards filing the CMC package as part of a potential U.S. New Drug Application (NDA) to be submitted for RHB-105, subject to successful completion of the planned confirmatory Phase III study.

Following a previous positive FDA meeting announced in April 2016, and in light of guidance received on the potential path for marketing approval of RHB-105, advanced preparations continue for the confirmatory Phase III study with RHB-105 for the treatment of *H. pylori* infection. The two-arm, randomized, double-blind, active comparator confirmatory Phase III study, comparing RHB-105 against a high-dose amoxicillin and omeprazole regimen, is planned to be initiated in the first half of 2017, after completion of the ongoing supportive pharmacokinetic (PK) program. The confirmatory Phase III study is planned to enroll approximately 440 patients in up to 55 clinical sites in the U.S.

The planned confirmatory Phase III study, along with the results from the successfully completed first Phase III study with RHB-105 (the ERADICATE Hp study) and data to be obtained from the ongoing supportive PK program, are expected to support an NDA for RHB-105.

The ERADICATE Hp Phase III study with RHB-105 successfully met its primary endpoint of superiority over historical standard-of-care (SoC) eradication rate of 70%, with high statistical significance ($p < 0.001$). The ERADICATE Hp study results demonstrated 89.4% efficacy in eradicating *H. pylori* infection with RHB-105. Notably, subsequent open-label treatment with SoC therapies of patients in the placebo arm of the ERADICATE Hp study demonstrated only 63% eradication rate, further supporting the potential superior efficacy of RHB-105 over SoC.

RHB-105 was granted Qualifying Infectious Disease Product (QIDP) designation by the FDA, providing a Fast-Track development pathway, as well as NDA Priority Review status, potentially leading to a shorter NDA review time by the FDA, if filed. If approved, RHB-105 will also receive an additional five years of U.S. market exclusivity, in addition to the standard exclusivity period, for a total of 8 years of U.S. market exclusivity.

RedHill is pursuing with RHB-105 an indication of first-line treatment of *H. pylori* infection, regardless of ulcer status, a significantly broader indication than current standard treatments for *H. pylori*, which are typically indicated only for patients with active or recent history of duodenal ulcer disease. If approved, RHB-105 may be the first *H. pylori* eradication therapy to target this broader indication, which would significantly expand the potential patient population for this drug candidate.

H. pylori bacterial infection is a major cause of chronic gastritis, peptic ulcer disease, gastric cancer and mucosa-associated lymphoid tissue (MALT) lymphoma. *H. pylori* infection is estimated to affect over half of the adult population worldwide. The growing resistance of the *H. pylori* bacteria to metronidazole and clarithromycin has resulted in increasing failure rates of current SoC for *H. pylori* eradication, reaching an estimated 30%¹. Despite the strong unmet medical need, no new drug has been approved by the FDA for this indication in over a decade.

The 2015 global and U.S. market potential for *H. pylori* eradication therapies at current branded prices, were estimated at approximately \$4.83 billion and \$1.45 billion, respectively, and could potentially grow with increasing awareness of the health risks associated with *H. pylori* infection and the benefits of its eradication².

About RHB-105:

RHB-105 is a new and proprietary fixed-dose oral combination therapy of two antibiotics and a proton pump inhibitor (PPI) in an all-in-one oral capsule with a planned indication for the treatment of *H. pylori* infection. *H. pylori* bacterial infection is a major cause of chronic gastritis, peptic ulcer disease, gastric cancer and mucosa-associated lymphoid tissue (MALT) lymphoma. A first Phase III study with RHB-105 was completed in the U.S. with positive results (the ERADICATE Hp study). The study demonstrated an overall success rate of 89.4% in eradicating *H. pylori*, and met its protocol-defined primary endpoint of superiority in eradication of *H. pylori* infection over historical standard-of-care efficacy levels of 70%, with high statistical significance ($p < 0.001$). A confirmatory Phase III study is planned to be initiated in the U.S. Additional studies may be required, subject to FDA feedback. RHB-105 has been granted Qualifying Infectious Disease Product (QIDP) designation by the FDA, providing a Fast-Track development pathway, as well as NDA Priority Review status, potentially leading to a shorter NDA review time by the FDA, if filed. If approved, RHB-105 will also receive an additional five years of exclusivity, in addition to the standard exclusivity period, for a total of 8 years of U.S. market exclusivity.

About RedHill Biopharma Ltd.:

RedHill Biopharma Ltd. (NASDAQ/TASE: RDHL) is a biopharmaceutical company headquartered in Israel, primarily focused on the development and commercialization of late clinical-stage, proprietary, orally-administered, small molecule drugs for the treatment of gastrointestinal and inflammatory diseases and cancer. RedHill's pipeline of proprietary products includes: (i) **RHB-105** - an oral combination therapy for the treatment of *Helicobacter pylori* infection with successful results from a first Phase III study; (ii) **RHB-104** - an oral combination therapy for the treatment of Crohn's disease with an ongoing first Phase III study and an ongoing proof-of-concept Phase IIa study for multiple sclerosis; (iii) **BEKINDA® (RHB-102)** - a once-daily oral pill formulation of ondansetron with an
